Received 16 October 2007; Revised 16 January 2008; Accepted 9 March 2008

We obtain two theorems to determine the error bound between input periodic signals and processed output signals, whenever signals belong to $H^\omega$-space and as a processor we have taken $(C, 1)(E, 1)$-mean and generalized an early result of Lal and Yadav in 2001.

1. Introduction

Chandra [1] was first to extend Prössdorf’s [2] result to find the degree of approximation of a continuous function using the Nörlund transform. Later on, Mohapatra and Chandra [3] obtained a number of interesting results on the degree of approximation in the Hölder metric using matrix transforms, which generalize all the previous results based on Cesàro and Nörlund transforms. In 1992, Singh [4] introduced $H^\omega$-space in place of $H^\alpha$-space and obtained several results on the degree of approximation of functions and deduced many previous results based on $H^\alpha$-spaces. In 1996, Das et al. [5] used $H_{(\alpha,p)}$-space in place of $H^\alpha$-space and obtained degree of approximation of functions and generalized the results of Mohapatra and Chandra [3]. In 2000, Mittal and Rhoades [6] also obtained the degree of approximation of functions in a normed space and generalized the results of Singh [4] by removing the hypothesis of monotonicity of the rows of the matrix. Singh and Soni [7], and Mittal et al. [8] used the technique of approximation of functions in measuring the errors in the input signals and the processed output signals.
2. Definitions and notations

Let the transforms

\[ A: \quad \lambda_n = \sum_{k=1}^{n} a_{nk} s_k, \quad (2.1) \]

\[ B: \quad \tau_n = \sum_{k=1}^{n} b_{nk} s_k, \quad (2.2) \]

be two regular methods of summability. Then, the A transform of the B transform of a sequence \( \{ s_n \} \) is given by

\[ t_n = \sum_{p=1}^{n} a_{np} \tau_p = \sum_{p=1}^{n} \sum_{k=1}^{n} a_{np} b_{pk} s_k, \quad (2.3) \]

the sequence \( \{ s_n \} \) is said to be summable \( t_n \) to the sum \( s \), if

\[ \lim_{n \to \infty} t_n = s. \quad (2.4) \]

Let \( s(t) \in C_{2\pi} \) be a \( 2\pi \)-periodic analog signal whose Fourier trigonometric expansion be given by

\[ s(t) \sim \frac{1}{2} a_0 + \sum_{n=1}^{\infty} \left( a_n \cos nt + b_n \sin nt \right) \equiv \sum_{n=0}^{\infty} A_n(t), \quad (2.5) \]

and let \( \{ s_n(t) \} \) be the sequence of partial sums of (2.5).

Let the \((E, 1)\) and \((C, 1)\) transforms for the sequence \( \{ s_n \} \) be defined by

\[ E_n^1 = \frac{1}{2^n} \sum_{k=0}^{n} \binom{n}{k} s_k(t), \quad (2.6) \]

\[ \sigma_n = \frac{1}{n} \sum_{k=0}^{n} s_k(t), \quad (2.7) \]

respectively.

The product \((C, 1)(E, 1)\)-transform is expressed as the \((C, 1)\)-transform of \((E, 1)\)-transform of \( \{ s_n \} \) and is given by sequence-to-sequence transformation (see, e.g., [9]):

\[ t_n(s; t) = \frac{1}{n+1} \sum_{k=0}^{n} E_k^1. \quad (2.8) \]

The sequence \( \{ s_n \} \) is said to be summable \((C, 1)(E, 1)\) to the sum \( s \), if

\[ \lim_{n \to \infty} t_n(s; t) = s. \quad (2.9) \]
2.1. Regularity condition of \( (C, 1)(E, 1) \)-method

\[
t_n(s; t) = \frac{1}{n + 1} \sum_{k=0}^{n} E_k^s = \frac{1}{n + 1} \sum_{k=0}^{n} \left\{ \frac{1}{2^k} \sum_{\nu=0}^{k} \binom{k}{\nu} s_k \right\} = \sum_{k=0}^{\infty} C_{n,k} s_k,
\]

where

\[
C_{n,k} = \begin{cases} \frac{1}{n + 1} 2^{-k} \sum_{\nu=0}^{k} \binom{k}{\nu}, & k \leq n \\ 0, & k > n. \end{cases}
\]

Now,

(i) \( \sum_{k=0}^{\infty} |C_{n,k}| = \sum_{k=0}^{n} (1/(n + 1)) \frac{1}{2^k} \sum_{\nu=0}^{k} (\binom{k}{\nu}) = 1 \),

(ii) \( C_{n,k} = (1/(n + 1)) (1) \rightarrow 0, \) as \( n \rightarrow \infty, \) for fixed \( k \),

(iii) \( \sum_{k=0}^{\infty} C_{n,k} = 1 \),

thus, \( (C, 1)(E, 1) \)-method is regular.

Singh [4] defined the space \( H_\omega \) by

\[
H_\omega = \{ s(t) \in C_{2\pi} : |s(t_1) - s(t_2)| \leq K\omega(|t_1 - t_2|) \},
\]

and the norm \( \| \cdot \|_{\omega^*} \) by

\[
\|s\|_{\omega^*} = \|s\|_c + \operatorname{Sup}_{t_1, t_2} \{ \Delta^\omega s(t_1, t_2) \},
\]

where

\[
\|s\|_c = \operatorname{Sup}_{0 \leq t \leq 2\pi} |s(t)|,
\]

\[
\Delta^\omega s(t_1, t_2) = \frac{|s(t_1) - s(t_2)|}{\omega^*(|t_1 - t_2|)}, \quad t_1 \neq t_2,
\]

and choosing \( \Delta^0 s(t_1, t_2) = 0, \omega(t) \) and \( \omega^*(t) \) being increasing signals of \( t \). If \( \omega(|t_1 - t_2|) \leq A|t_1 - t_2|^\beta \) and \( \omega^*|t_1 - t_2| \leq K|t_1 - t_2|^\alpha, \) \( 0 \leq \beta < \alpha \leq 1, \) \( A \) and \( K \) being positive constants, then the space

\[
H_\alpha = \{ s(t) \in C_{2\pi} : |s(t_1) - s(t_2)| \leq K|t_1 - t_2|^\alpha, \quad 0 < \alpha \leq 1 \}
\]

is Banach space [2] and the metric induced by the norm \( \| \cdot \|_\alpha \) on \( H_\alpha \) is said to be Hölder metric.

We write

\[
\phi_i(t) = s(t_1 + t) + s(t_1 - t) - 2s(t_1),
\]

\[
K_n(t) = \sin(n + 1)^2 \sum_{k=0}^{n} \binom{n}{k} \sin\left(k + \frac{1}{2}\right)t.
\]
3. Known result

Lal and Yadav [10] established the following theorem to estimate the error between the input signal \( s(t) \) and the signal obtained after passing through the \((C,1)(E,1)\)-transform.

**Theorem A.** If a function \( s : R \to R \) is \( 2\pi \)-periodic and belonging to class \( \text{Lip } \alpha \), \( 0 < \alpha \leq 1 \), then the degree of approximation by \((C,1)(E,1)\) means of its Fourier series is given by

\[
\| t_n(s;t_1) - s(t_1) \|_{\infty} = \begin{cases} 
  O(n^{-\alpha}), & 0 < \alpha < 1 \\
  O\left(\frac{\log n}{n}\right), & \alpha = 1.
\end{cases}
\]  

(3.1)

4. Main result

The object of this paper is to generalize the above result under much more general assumptions. We will measure the error between the input signal \( s(t) \) and the processed output signal \( t_n(s;t) = (1/(n+1)) \sum_{k=1}^{n} E_k^j(t) \), by establishing the following theorems.

**Theorem 4.1.** Let \( \omega(t) \) defined in (2.12) be such that

\[
\int_{t}^{\pi} \frac{\omega(u)}{u^2} du = O\{H(t)\}, \quad H(t) \geq 0,
\]  

(4.1)

\[
\int_{0}^{t} H(u) du = O\{tH(t)\}, \quad \text{as } t \to 0^+,
\]  

(4.2)

then, for \( 0 \leq \beta < \eta \leq 1 \) and \( s \in H_{\omega} \), we have

\[
\| t_n(s;t_1) - s \|_{\omega^r} = O\left\{ \left( (n+1)^{-1} H\left( \frac{\pi}{n+1} \right) \right)^{1-\beta/\eta} \right\}. \]  

(4.3)

**Theorem 4.2.** Let \( \omega(t) \) defined in (2.12) and for \( 0 \leq \beta < \eta \leq 1 \) and \( s \in H_{\omega} \), we have

\[
\| t_n(s;t_1) - s \|_{\omega^r} = O\left\{ \omega\left( \frac{\pi}{n+1} \right)^{1-\beta/\eta} + \left( (n+1)^{-1} \sum_{k=1}^{n+1} \omega\left( \frac{1}{k+1} \right) \right)^{1-\beta/\eta} \right\}. \]  

(4.4)

5. Lemmas

We will use following lemmas.

**Lemma 5.1.** Let \( \phi_1(t) \) be defined in (2.16), then for \( s \in H_{\omega} \), we have

\[
|\phi_1(t) - \phi_2(t)| \leq 4K\omega(|t_1 - t_2|),
\]  

(5.1)

\[
|\phi_1(t) - \phi_2(t)| \leq 4K\omega(|t|).
\]  

(5.2)

It is easy to verify.
Lemma 5.2. Let \( K_n(t) \) be defined in (2.17), then
\[
K_n(t) \leq C\left(\frac{2^{n+1}}{t}\right)\cos^n\left(\frac{t}{2}\right)\sin(n+1)\left(\frac{t}{2}\right),
\]
where “\( C \)” is an absolute constant, not necessarily the same at each occurrence.

Proof.
\[
K_n(t) = \frac{1}{\sin(t/2)} \text{I.P.} \left\{ \sum_{k=0}^{n} \binom{n}{k} e^{i(k+1)t/2} \right\} \\
= \frac{1}{\sin(t/2)} \text{I.P.} \left\{ e^{it/2}(1 + e^{it})^n \right\} \\
= \frac{1}{\sin(t/2)} \text{I.P.} \left\{ 2^n \cos^n\left(\frac{t}{2}\right)e^{i(n+1)t/2} \right\} \\
\leq C\left(\frac{2^{n+1}}{t}\right)\cos^n\left(\frac{t}{2}\right)\sin(n+1)\left(\frac{t}{2}\right).
\]

Lemma 5.3.
\[
\sum_{k=0}^{n} \left(\frac{1}{t}\right)\cos^k\left(\frac{t}{2}\right)\sin(k+1)\left(\frac{t}{2}\right) \leq \left(\frac{C}{t^2}\right)\left(1 - \cos(n+1)\left(\frac{t}{2}\right)\cos^{n+1}\left(\frac{t}{2}\right)\right).
\]

Proof.
\[
\sum_{k=0}^{n} \left(\frac{1}{t}\right)\cos^k\left(\frac{t}{2}\right)\sin(k+1)\left(\frac{t}{2}\right) \\
= \sum_{k=0}^{n} \left(\frac{1}{t}\right) \text{I.P.} \left\{ e^{i(k+1)t/2}\cos^k\left(\frac{t}{2}\right) \right\} \\
= \left(\frac{1}{t}\right) \text{I.P.} \left\{ e^{it/2}\left(\frac{1 - e^{i(n+1)t/2}\cos^{n+1}\left(\frac{t}{2}\right)}{1 - e^{it/2}\cos(t/2)}\right) \right\} \\
\leq \left(\frac{C}{t^2}\right) \text{I.P.} \left\{ i - i\cos(n+1)\left(\frac{t}{2}\right)\cos^{n+1}\left(\frac{t}{2}\right) + \sin(n+1)\left(\frac{t}{2}\right)\cos^{n+1}\left(\frac{t}{2}\right) \right\} \\
= \left(\frac{C}{t^2}\right)\left(1 - \cos(n+1)\left(\frac{t}{2}\right)\cos^{n+1}\left(\frac{t}{2}\right)\right).
\]

Lemma 5.4 (see [9]). For \( 0 \leq t \leq 1/n + 1 \), then
\[
1 - \cos(n+1)\left(\frac{t}{2}\right)\cos^{n+1}\left(\frac{t}{2}\right) = O\{(n+1)^2t^2\}.
\]

Lemma 5.5 (see [6]). If \( \omega(t) \) satisfies conditions (4.1) and (4.2), then
\[
\int_{0}^{u} t^{-1}\omega(t)dt = O(uH(u)), \quad u \rightarrow 0^*.
\]
6. Proof of Theorem 4.1

Proof of Theorem 4.1. Following Zygmund [11], we have

\[ s_n(t_1) - s = \frac{1}{2\pi} \int_{0}^{\pi} \frac{\phi_n(t)}{\sin(t/2)} \sin \left( n + \frac{1}{2} \right) t \, dt. \]  

(6.1)

From (2.6) and (2.16), we have

\[ E_n^1(t_1) - s = \frac{2^{-n/2}}{2\pi} \int_{0}^{\pi} \phi_n(t) K_n(t) \, dt. \]  

(6.2)

Using Lemma 5.2, we have

\[ E_n^1(t_1) - s \leq C \frac{2^{-(n+1)}}{\pi} \int_{0}^{\pi} \left| \phi_n(t) \right| \left| \sum_{k=0}^{n} \frac{1}{t} \cos \left( \frac{t}{2} \right) \sin(k+1) \left( \frac{t}{2} \right) \right| \, dt. \]  

(6.3)

Now from (2.8), the \((C,1)\)-transform of \((E,1)\)-transform is given by

\[ |t_n(s; t_1) - s| \leq \frac{C}{n+1} \int_{0}^{\pi} \left| \frac{\phi_n(t)}{t} \right| \left| \sum_{k=0}^{n} \cos \left( \frac{t}{2} \right) \sin(k+1) \left( \frac{t}{2} \right) \right| \, dt. \]  

(6.4)

Setting

\[ E_n(t_1) = |t_n(s; t_1) - s(t_1)| \leq \frac{C}{n+1} \int_{0}^{\pi} \left| \frac{\phi_n(t)}{t} \right| \left| \sum_{k=0}^{n} \cos \left( \frac{t}{2} \right) \sin(k+1) \left( \frac{t}{2} \right) \right| \, dt, \]

\[ E_n(t_1, t_2) = |E_n(t_1) - E_n(t_2)| \leq \frac{C}{n+1} \int_{0}^{\pi} \left| \frac{\phi_n(t)}{t} \right| \left| \sum_{k=0}^{n} \cos \left( \frac{t}{2} \right) \sin(k+1) \left( \frac{t}{2} \right) \right| \, dt \]

\[ = O \left( \frac{1}{n+1} \right) \left( \int_{0}^{\pi/n+1} + \int_{\pi/n+1}^{\pi} \right) = I_1 + I_2, \]  

say,

(6.5)

now using (4.1), (4.2), (5.2), and Lemma 5.5, we get

\[ I_1 = O(1) \frac{1}{n+1} \int_{0}^{\pi/n+1} t^{-1} \omega(t) \, dt = O \left\{ (n+1)^{-1} H \left( \frac{\pi}{n+1} \right) \right\}. \]  

(6.6)

Again using (5.2), (4.1), and Lemma 5.3, we have

\[ I_2 = O(1) \frac{1}{n+1} \int_{\pi/n+1}^{\pi} t^{-2} \omega(t) \left| 1 - \cos(n+1) \left( \frac{t}{2} \right) \cos^{n+1} \left( \frac{t}{2} \right) \right| \, dt \]

\[ = O(1) \frac{1}{n+1} \int_{\pi/n+1}^{\pi} t^{-2} \omega(t) \, dt \]

\[ = O \left\{ (n+1)^{-1} H \left( \frac{\pi}{n+1} \right) \right\}. \]  

(6.7)
Now from (5.1), Lemmas 5.3 and 5.4, we have

\[ I_1 = O(1) \frac{1}{n + 1} \int_0^{\pi/(n + 1)} \frac{\omega'(t_1 - t_2)}{t^2} \left| 1 - \cos(n + 1) \left( \frac{t}{2} \right) \cos^{n+1} \left( \frac{t}{2} \right) \right| dt \]

\[ = O(1) \frac{\omega'(t_1 - t_2)}{n + 1} \int_0^{\pi/(n + 1)} t^{-2}(n + 1)^2 t^2 dt \]

\[ = O\{\omega(|t_1 - t_2|)\}, \quad (6.8) \]

\[ I_2 = O(1) \frac{\omega'(t_1 - t_2)}{n + 1} \int_{\pi/(n + 1)}^\pi t^{-2} dt \]

\[ = O\{\omega(|t_1 - t_2|)\}. \quad (6.9) \]

Now noting that

\[ I_r = I_r^{-\beta/\eta} r^\beta/\eta, \quad r = 1, 2, \quad (6.10) \]

we have, from (6.6) and (6.8),

\[ I_1 = O\left\{\left(\omega(|t_1 - t_2|)\right)^{\beta/\eta} \left((n + 1)^{-1} H \left(\frac{\pi}{n + 1}\right)\right)^{1-\beta/\eta}\right\}. \quad (6.11) \]

and from (6.7) and (6.9), we have

\[ I_2 = O\left\{\left(\omega(|t_1 - t_2|)\right)^{\beta/\eta} \left((n + 1)^{-1} H \left(\frac{\pi}{n + 1}\right)\right)^{1-\beta/\eta}\right\}. \quad (6.12) \]

Thus, from (2.13), (6.11) and (6.12), we have

\[ \sup\Delta^{\omega^*} |E_n(t_1, t_2)| = \sup_{t_1, t_2} \frac{|E_n(t_1) - E_n(t_2)|}{\omega^* (|t_1 - t_2|)} \]

\[ = O\left\{\left(\omega(|t_1 - t_2|)\right)^{\beta/\eta} \left(\omega^* (|t_1 - t_2|)\right)^{-1} \left((n + 1)^{-1} H \left(\frac{\pi}{n + 1}\right)\right)^{1-\beta/\eta}\right\}. \quad (6.13) \]

It is to be noted from (6.6) and (6.7),

\[ \|E_n(t_1)\|_c = \max_{0 \leq t_1 \leq 2\pi} |E_n(t_1) - s| = O\left((n + 1)^{-1} H \left(\frac{\pi}{n + 1}\right)\right). \quad (6.14) \]

Combining (6.13) and (6.14), we get

\[ \|t_n(s; t_1) - s\|_{\omega^*} = O\left((n + 1)^{-1} H \left(\frac{\pi}{n + 1}\right)^{1-\beta/\eta}\right). \quad (6.15) \]

This completes the proof of Theorem 4.1.

Proof of Theorem 4.2. Follows analogously as the proof of Theorem 4.1 with slight changes, so we omit details.
7. Applications

The following results can easily be derived from the Theorem 4.1. If we put $\omega^*(|t_1 - t_2|) \leq K|t_1 - t_2|^\beta$, $\omega(|t_1 - t_2|) \leq A|t_1 - t_2|^\alpha$ and replace $\eta$ by $\alpha$ and set

$$H(u) = \begin{cases} 
\alpha^{a-1}, & 0 < a < 1 \\
\log \left( \frac{1}{u} \right), & a = 1,
\end{cases} \quad (7.1)$$

then we get Corollary 7.1.

**Corollary 7.1.** If $s \in H_\alpha$, $0 \leq \beta < \alpha \leq 1$, then

$$\|t_n(s; t_1) - s\|_\beta = \begin{cases} 
O(n + 1)^{-\alpha}, & 0 < \alpha < 1 \\
O\left( \frac{\log(n + 1)}{n + 1} \right)^{1-\beta}, & a = 1.
\end{cases} \quad (7.2)$$

If we put $\beta = 0$, then from above corollary, we have Corollary 7.2.

**Corollary 7.2.** If $s \in \text{Lip } \alpha$, $0 < \alpha \leq 1$, then

$$\|t_n(s; t_1) - s\| = \begin{cases} 
O(n^{-\alpha}), & 0 < \alpha < 1 \\
O\left( \frac{\log n}{n} \right), & a = 1.
\end{cases} \quad (7.3)$$

Hence Theorem 3 is particular case of Theorem 4.1.

**Acknowledgment**

The authors are highly grateful to the referee for his valuable comments and suggestions for the improvement and the better presentation of the paper.

Special Issue on Boundary Value Problems on Time Scales

Call for Papers

The study of dynamic equations on a time scale goes back to its founder Stefan Hilger (1988), and is a new area of still fairly theoretical exploration in mathematics. Motivating the subject is the notion that dynamic equations on time scales can build bridges between continuous and discrete mathematics; moreover, it often reveals the reasons for the discrepancies between two theories.

In recent years, the study of dynamic equations has led to several important applications, for example, in the study of insect population models, neural network, heat transfer, and epidemic models. This special issue will contain new researches and survey articles on Boundary Value Problems on Time Scales. In particular, it will focus on the following topics:

- Existence, uniqueness, and multiplicity of solutions
- Comparison principles
- Variational methods
- Mathematical models
- Biological and medical applications
- Numerical and simulation applications

Before submission authors should carefully read over the journal's Author Guidelines, which are located at http://www.hindawi.com/journals/ade/guidelines.html. Authors should follow the Advances in Difference Equations manuscript format described at the journal site http://www.hindawi.com/journals/ade/. Articles published in this Special Issue shall be subject to a reduced Article Processing Charge of €200 per article. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at http://mts.hindawi.com/ according to the following timetable:
